

Executive Summary Template

Recommended Solution

- Deploy the Random Forest model to identify customers at high risk of churn.
- Target these customers with personalized retention offers, pricing incentives, and renewal campaigns.
- Retrain the model regularly using updated customer and pricing data to improve prediction accuracy.

Situation

- The client wants to reduce customer churn and improve retention.
- Customer usage, pricing, and churn data were analyzed using EDA, feature engineering, and machine learning.
- A predictive model was developed to identify customers most likely to churn.

Complication

- Churn is driven by multiple factors, making manual identification difficult.
- Price sensitivity alone is not the strongest driver; customer behavior and contract-related features also influence churn.
- The dataset is imbalanced, requiring a robust predictive approach.

Question

How can the client proactively identify at-risk customers and implement effective retention strategies to reduce churn and increase revenue?
